

1) Find the PRIME FACTORIZATION

a) 700

```

graph TD
    700 --> 7
    700 --> 100
    100 --> 4
    100 --> 25
    4 --> 2
    4 --> 2
    25 --> 5
    25 --> 5
    7 * 100 * 2 * 2 * 5 * 5 = 2^2 * 5^2 * 7
  
```

$$700 = 2^2 \cdot 5^2 \cdot 7$$

b) 1560

```

graph TD
    1560 --> 10
    1560 --> 156
    10 --> 2
    10 --> 5
    156 --> 2
    156 --> 78
    2 --> 2
    78 --> 3
    78 --> 13
    3 --> 3
    13 --> 13
    1560 = 2^3 * 3 * 5 * 13
  
```

$$1560 = 2^3 \cdot 3 \cdot 5 \cdot 13$$

c) 3465

```

graph TD
    3465 --> 3
    3465 --> 1155
    3 --> 3
    1155 --> 11
    1155 --> 105
    11 --> 11
    105 --> 3
    105 --> 35
    3 --> 3
    35 --> 5
    35 --> 7
    5 --> 5
    7 --> 7
    3465 = 3^2 * 5 * 7 * 11
  
```

$$3465 = 3^2 \cdot 5 \cdot 7 \cdot 11$$

d) 70840

```

graph TD
    70840 --> 10
    70840 --> 7084
    10 --> 2
    10 --> 5
    7084 --> 7
    7084 --> 1012
    2 --> 2
    5 --> 5
    7 --> 7
    1012 --> 4
    1012 --> 253
    4 --> 2
    4 --> 2
    253 --> 11
    253 --> 23
    11 --> 11
    23 --> 23
    70840 = 2^3 * 5 * 7 * 11 * 23
  
```

$$70840 = 2^3 \cdot 5 \cdot 7 \cdot 11 \cdot 23$$

2) Determine if prime (P), composite (C), or neither

a) 12 C 2 is a factor of 12 that's different from 1, different from 12

b) 123 C $3 \mid 123$ (sum of digits = 6 and $3 \mid 6$)

c) 1234 C $2 \mid 1234$ (note: any even number > 2 is COMPOSITE)

d) 12345 C $5 \mid 12345$

e) 154 C $2 \mid 154$

f) 102302320 C 2 is a factor

g) 1 NEITHER (A prime has exactly two (pos) divisors; a composite has more than two (pos) divisors. 1 has exactly one (pos) divisor, namely 1)

h) 97 P The only divisors of 97 are 1 and 97 (We'll see in 5.4 that it suffices to check if 97 is divisible by 2, 3, 5, 7. (TEST FOR PRIMENESS)) Since none of these divide 97, we can conclude 97 is prime)

3) a) $63 = 3^2 \cdot 7$

b) $768 = 2^8 \cdot 3$

c) $324 = 2^2 \cdot 3^4$

d) $361 = 19^2$

e) $196 = 2^2 \cdot 7^2$

f) $1024 = 2^{10}$

g) $480 = 2^5 \cdot 3 \cdot 5$

h) $10,000 = 2^4 \cdot 5^4$

$10,000 = 10^4 = (2 \cdot 5)^4 = 2^4 \cdot 5^4$

$$5) \text{ a) } 10! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10$$

10 factorial

$$= 1 \cdot 2 \cdot 3 \cdot (2 \cdot 2) \cdot 5 \cdot (2 \cdot 3) \cdot 7 \cdot (2 \cdot 2 \cdot 2) \cdot (3 \cdot 3) \cdot (2 \cdot 5)$$

$$= 2^8 \cdot 3^4 \cdot 5^2 \cdot 7$$

b) Is $10!$ divisible

- i) by 10? YES since $10 = 2 \cdot 5$
- ii) by 30? YES since $30 = 2 \cdot 3 \cdot 5$
- iii) by 120? YES since $120 = 2^3 \cdot 3 \cdot 5$
- iv) by 1000? No since $1000 = 2^3 \cdot 5^3$

here's why

The power on 5 in 1000 is
larger than the power on 5 in $10!$

* KEY to b)

Any divisor of $10!$ must look like

$$2^r \cdot 3^s \cdot 5^t \cdot 7^w$$

where r can be any whole no.
 $0 \leq r \leq 8$ (from 0 to 8)

s can be any whole no.
 $0 \leq s \leq 4$ (from 0 to 4)

t can be 0, 1, or 2
 $0 \leq t \leq 2$

w can be 0 or 1
 $0 \leq w \leq 1$

Alternatively

$$10! \text{ is divisible by 10 since } 10! = \underline{10} \cdot (1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9)$$

$$10! \text{ is divisible by 30 since } 10! = (\underline{3 \cdot 10}) \cdot \frac{\underline{\hspace{2cm}}}{30} (1 \cdot 2 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9)$$

$$10! \text{ is divisible by 120 since } 10! = (\underline{3 \cdot 5 \cdot 8}) \cdot \frac{\underline{\hspace{2cm}}}{120} (1 \cdot 2 \cdot 4 \cdot 6 \cdot 7 \cdot 9 \cdot 10)$$

c) Is $30!$ divisible by 2,400,000? YES

Think of 30 factorial

$$\text{Can we write } 30! \text{ as a multiple of } 24 \cdot 10^5 \text{ or } 24 \cdot 2^5 \cdot 5^5$$

$$30! = 1 \cdot 2 \cdot 3 \cdot \underline{4} \cdot \underline{5} \cdots \underline{8} \cdot 9 \cdot 10 \cdots \underline{15} \cdots \cdots \underline{24} \cdot \underline{25} \cdots \cdots \underline{30}$$

here's 4 & 8 which is 2^5 or 32

here are five 5's or 5^5

here's 24

5 & 5

$$\text{So } 30! = 24 \cdot 2^5 \cdot 5^5 \cdot (\text{remaining factors}) = 2,400,000 \cdot (\text{remaining factors})$$

continued →

d) Find the largest N such that $18!$ is divisible by 12^N

$$18! = \underbrace{1 \cdot 2 \cdot 3 \cdot \dots \cdot 10 \cdot 11 \cdot 12 \cdot 13 \cdot 14 \cdot 15 \cdot 16 \cdot 17 \cdot 18}_{\text{In a) we saw that}}$$

$$10! = 2^8 3^4 5^2 7$$

$$\text{So } 18! = (2^8 3^4 5^2 7) \cdot 11 \cdot (2^2 \cdot 3) \cdot 13 \cdot (2 \cdot 7) \cdot (3 \cdot 5) \cdot (2^4) \cdot 17 \cdot (2 \cdot 3^2)$$

$$\text{So } 18! = 2^{16} 3^8 5^3 7^2 11 \cdot 13 \cdot 17$$

$$\text{Now } 12^N = (2^2 \cdot 3)^N = 2^{2N} \cdot 3^N$$

Based on the powers on 2 and 3 in the prime factorization of $18!$,
the largest N for which $18!$ is divisible by 12^N is $\boxed{N=8}$

$$12^8 = 2^{2(8)} \cdot 3^8 = 2^{16} \cdot 3^8, \text{ so } 12^8 \text{ is a factor of } 18!$$

$$12^9 = 2^{18} \cdot 3^9, \text{ so } 12^9 \text{ is } \underline{\text{not}} \text{ a factor of } 18!$$

These powers are too big!
They're both larger than the
respective powers on 2 and 3 in $18!$
