

Mental math can be fun [] but not all problems are amenable to the “tricks” we used.
We need algorithms (‘programmed’ procedures that always work) for the arithmetic operations.

Always work
Become automatic
Completes whole-number arithmetic

The mental math exercises have prepared our students.
They need to know arithmetic facts $1+1=2$, etc. ... , $9+9=18$ and
they need to know such things as $30+40=70$, $300+400=700$, etc.
before progressing to multi-digit addition algorithms.

Addition problems in order of difficulty:

$$\begin{array}{r} 7 \\ + 2 \\ \hline \end{array} \quad \begin{array}{r} 7 \\ + 6 \\ \hline \end{array} \quad \begin{array}{r} 12 \\ + 23 \\ \hline \end{array} \quad \begin{array}{r} 17 \\ + 25 \\ \hline \end{array} \quad \begin{array}{r} 32 \\ + 87 \\ \hline \end{array} \quad \begin{array}{r} 37 \\ + 66 \\ \hline \end{array}$$

(explain why each is more difficult)

ADDITION ALGORITHM

Due to ASSOCIATIVE & COMMUTATIVE properties of + we can rearrange the sum in any order & grouping. Aligning the columns is doing all that!

$$256 + 73$$

Performing the addition of tens, hundreds, etc. uses the DISTRIBUTIVE

$$\begin{array}{r} 256 \\ + 73 \\ \hline \end{array} = \begin{array}{r} 2 \cdot 100 + (5 \cdot 10) + 6 \cdot \text{UNITS} \\ + (7 \cdot 10) + 3 \cdot \text{UNITS} \end{array}$$

$$5 \cdot 10 + 7 \cdot 10 \quad \Leftrightarrow \text{says...}$$

$$(5 + 7) \cdot 10$$

$$12 \cdot 10$$

$$(10 + 2) \cdot 10$$

$$10 \cdot 10 + 2 \cdot 10$$

$$1 \cdot 100 + 2 \cdot 10$$

"Carrying"
is really

"Re-grouping"
"Re-bundling"

CHIP model:

HUNDREDS	TENS	ONES
○○	○○○ ○○○	○○○ ○○○ ○○○
3	2	9

Lattice addition:

$$\begin{array}{r} 2 \quad 5 \quad 6 \\ + \quad 7 \quad 3 \\ \hline \end{array}$$

Scratch addition:

$$\begin{array}{r} 5 \quad 6 \\ 7 \quad 3 \\ 4 \quad 9 \\ + \quad 5 \quad 5 \\ \hline \end{array}$$

CHIP model for $1354 + 3678$:
