## Math 140 <br> Introductory Statistics

Extra hours at the tutoring center

Fri Dec 3rd 10-4pm, Sat Dec 4 11-2 pm
Final Dec 14th 5:30-7:30pm CH 5122

## Left handed people

## 113 out of 1067 males are left handed 92 out of 1170 females are left handed

Perform a significance test to see whether males Are more likely to be left handed than women.

Null hypothesis?
Alternate hypothesis?

## Left handed people

113 out of 1067 males are left handed 92 out of 1170 females are left handed

Perform a significance test to see whether males Are more likely to be left handed than women.

$p_{1}$ male, $p_{2}$ female

Null hypothesis: $p_{1}=p_{2}$ Alternate hypothesis? $\mathrm{p}_{1}>\mathrm{p}_{2}$

## Left handed people

You try: check applicability of normal distribution, Check for the $95 \%$ confidence interval.

$$
\begin{aligned}
& \hat{p}_{1}=\frac{113}{1067}=0.106 \\
& \hat{p}_{2}=\frac{92}{1170}=0.079 \\
& \sigma_{\hat{p}_{1}-\hat{p}_{2}}=\sqrt{\frac{\hat{p}_{1}\left(1-\hat{p}_{1}\right)}{n_{1}}+\frac{\hat{p}_{2}\left(1-\hat{p}_{2}\right)}{n_{2}}}=\ldots .
\end{aligned}
$$

## Let's do it a bit differently

The null hypothesis says that $\mathrm{p}_{1}=\mathrm{p}_{2}$
We are going to create a POOLED estimate
Total number of left handed people $=113+92=205$
Total number of people $=1067+1170=2237$

Then, according to the null hypothesis,
p1, p2 should both be approximately 205/2237 $=0.091$

## Let's do it a bit differently

So we ESTIMATE the error of the difference in the following way:

$$
\begin{aligned}
\sqrt{\frac{\hat{p}_{1}\left(1-\hat{p}_{1}\right)}{n_{1}}+\frac{\hat{p}_{2}\left(1-\hat{p}_{2}\right)}{n_{2}}} & \approx \sqrt{\frac{\hat{p}(1-\hat{p})}{n_{1}}+\frac{\hat{p}(1-\hat{p})}{n_{2}}} \\
& =\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)}
\end{aligned}
$$

We also introduce a new test statistic $z$

## Let's do it a bit differently

$$
\begin{aligned}
& z=\frac{\text { statistic - parameter }}{\text { estimated } \text { standard error }}= \\
& =\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\frac{\hat{p}(1-\hat{p})}{n_{1}}+\frac{\hat{p}(1-\hat{p})}{n_{2}}}}=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)}}=2.23
\end{aligned}
$$

The alternative hypothesis is that $\mathrm{p}_{1}-\mathrm{p}_{2}>0$

## Let's do it a bit differently

$$
\begin{aligned}
& z=\frac{\text { statistic }- \text { parameter }}{\text { estimated } s \text { tandard error }}= \\
& =\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\frac{\hat{p}(1-\hat{p})}{n_{1}}+\frac{\hat{p}(1-\hat{p})}{n_{2}}}=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)}}=2.23}
\end{aligned}
$$

Our P value is 0.0129

## Overweight in America

2004: 1000 adults surveyed, $30 \%$ were overweight 2009: 1000 adults surveyed, $32 \%$ were overweight

Does this represent a real population change at the $10 \%$ significance level?

Of course, the difference is $0.32-0.30=0.02=2 \%$ But is this value statistically significant?

## Overweight in America

Null hypothesis, the real percentages of the Overweight population
p1 (2009) = p2 (2004)

Alternative hypothesis
p1 (2009) different than p2 (2004)

## Overweight in America

Check applicability:

$$
\begin{gathered}
0.30 * 1000=300 ; \\
0.32 * 1000=320 ; \\
(1-0.30)^{*} 1000=700 ; \\
(1-0.32)^{*} 1000=680 ;
\end{gathered}
$$

OK all are greater than 5

## Overweight in America

## Find the POOLED value of proportion of overweight people

Total number of overweight people $=300+320$
Total number of people polled $=1000+1000$
The pooled estimate is

$$
\hat{p}=\frac{620}{2000}=0.31
$$

## The test statistic z

$$
\begin{gathered}
\hat{p}=\frac{620}{2000}=0.31 \\
z=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\frac{\hat{p}(1-\hat{p})}{n_{1}}+\frac{\hat{p}(1-\hat{p})}{n_{2}}}}=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)}}=-0.97
\end{gathered}
$$

Now, recall, we want the two proportions to be statistically DIFFERENT

## The test statistic $z$

$$
z=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\frac{\hat{p}(1-\hat{p})}{n_{1}}+\frac{\hat{p}(1-\hat{p})}{n_{2}}}}=\frac{\left(\hat{p}_{1}-\hat{p}_{2}\right)-0}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)}}=-0.97
$$

So this is a double sided test, we need to ADD the two $P$ values

## The test statistic z

$$
\mathrm{P}=0.332
$$

To discard the null hypothesis we need

$$
P<\alpha
$$

For us the level of significance was $10 \%$ on either side, so we need to look at $\alpha=0.2$

## The test statistic z

$$
\mathrm{P}=0.332
$$

To discard the null hypothesis we need

> Either: $0.332<0.2$
> or: $0.166<0.1$

This is false, so we don't discard the null hypothesis

## You try it in the "old way"

Construct the $90 \%$ confidence interval
For the difference of overweight people between the years 2004 and 2009

$$
\begin{aligned}
& \text { p1 }(2009)=320 \text { out of } 1000 \\
& \text { p2(2004) }=300 \text { out of } 1000
\end{aligned}
$$

You should see that 0 is plausible.

## AIDS: AZT or AZT+ACV?

Treated with

| Survived? | AZT | AZT + ACV | Total |  |
| :---: | :---: | :---: | :---: | :---: |
|  | No | 28 | 13 | 41 |
|  | Yes | 41 | 49 | 90 |
|  | Total | 69 | 62 | 131 |

What is the null hypothesis?
What is the alternative hypothesis?

$$
\mathrm{n} 1, \mathrm{n} 2, \quad \hat{p}_{1}, \hat{p}_{2}
$$

## Hypotheses:

Null: the treatments
(AZT alone, or the cocktail AZT + ACV) give the same survival rate

$$
(\mathrm{AZT}) \mathrm{p} 1=\mathrm{p} 2(\mathrm{ACV})
$$

Alternative: the AZT + ACV is better

$$
\mathrm{p} 1<\mathrm{p} 2
$$

## Find:

$n_{1}=69$ sample size of patients treated with AZT
$n_{2}=62$ sample size of patients treated with $A Z T+A C V$
$\hat{p}_{1}=\frac{41}{69} \quad \begin{aligned} & \text { proportion of patients in the sample treated with AZT } \\ & \text { that survived }\end{aligned}$
$\hat{p}_{2}=\frac{49}{62} \quad \begin{aligned} & \text { proportion of patients in the sample treated with } \\ & \mathrm{AZT}+\mathrm{ACV} \text { that survived }\end{aligned}$
$p_{1} \quad$ True proportion of survival if all patients were treated with AZT (unknown)
$p_{2} \quad$ True proportion of survival if all patients were treated with $\mathrm{AZT}+\mathrm{ACV}$ (unknown)

## Check all requirements are satisfied

## The z statistic

$n_{1}=69$ sample size of patients treated with AZT
$n_{2}=62$ sample size of patients treated with AZT + ACV
$\hat{p}_{1}=\frac{41}{69} \quad \begin{aligned} & \text { proportion of patients in the sample treated with AZT } \\ & \text { that survived }\end{aligned}$
$\hat{p}_{2}=\frac{49}{6} \quad \begin{aligned} & \text { proportion of patients in the sample treated with }\end{aligned}$ $A Z T+A C V$ that survived
$p_{1} \quad$ True proportion of survival if all patients were treated with AZT (unknown)
$p_{2} \quad$ True proportion of survival if all patients were treated with $A Z T+A C V$ (unknown)

# Check all <br> Conditions 

Find the z statistic using

$$
\hat{p}=\frac{\text { survived }}{\text { total }}=\frac{41+49}{69+62}=0.687
$$

## The z statistic

Our alternative hypothesis is that p 1 (AZT) is worse than p2 (AZT+ACV),

$$
\mathrm{p} 1<\mathrm{p} 2
$$

Where do we look on Table 1, page 759?

## The z statistic

# Check all <br> Conditions 

$P$ value 0.0078

$$
z=\frac{(0.594-0.790)-0}{\sqrt{0.687(1-0.687)\left(\frac{1}{69}+\frac{1}{62}\right)}}=-2.415
$$

## The z statistic

# We reject the null hypothesis, because the P value is extremely small. 

$$
\mathrm{P}=0.0078
$$

## $\mathrm{AZT}+\mathrm{ACV}$ is better

## The Flu

Treatment

| Influenza? | Yes | Treatment |  | Total |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Surgical Mask | N95 Respirator |  |
|  |  | 50 | 48 | 98 |
|  | No | 175 | 173 | 348 |
|  | Total | 225 | 221 | 446 |

Two anti-flu masks esist
Surgical are cheaper, but don't always fit right N95 are more expensive, but fit better

Experiments to check their effectiveness

## The Flu

|  |  | Treatment |  | Total |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Surgical Mask | N95 Respirator |  |
| Influenza? | Yes | 50 | 48 | 98 |
|  | No | 175 | 173 | 348 |
|  | Total | 225 | 221 | 446 |

Null hypothesis: p1 = p2
Alternate hypothesis p1 different than p2

## The Flu

|  |  | Treatment |  | Total |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Surgical Mask | N95 Respirator |  |
| Influenza? | Yes | 50 | 48 | 98 |
|  | No | 175 | 173 | 348 |
|  | Total | 225 | 221 | 446 |

Check applicability using

$$
\mathrm{p} 1=50 / 225, \mathrm{p} 2=48 / 221
$$

## The Flu

Treatment

| Influenza? |  | Surgical Mask | N95 Respirator | Total |
| :---: | :---: | :---: | :---: | :---: |
|  | Yes | 50 | 48 | 98 |
|  | No | 175 | 173 | 348 |
|  | Total | 225 | 221 | 446 |

Test statistic

$$
z=\frac{(50 / 225-48 / 221)-0}{\sqrt{0.219(1-0.219)\left(\frac{1}{225}+\frac{1}{221}\right)}}=0.128
$$

## The Flu

Treatment

| Influenza? |  | Surgical Mask | N95 Respirator | Total |
| :---: | :---: | :---: | :---: | :---: |
|  | Yes | 50 | 48 | 98 |
|  | No | 175 | 173 | 348 |
|  | Total | 225 | 221 | 446 |

$$
P \text { value }=2^{*}(0.4483)=0.8966
$$

We need to see whether they are different, so this is a two sided test

LARGE! The two masks perform more in the same way.

## The Flu

This means:

## If the difference in flu infectivity was really 0 between the two mask types

then the probability we would get a difference of p1-p2 $=50 / 225-48 / 221=0.005$ between our measured data is 0.8990

Large probability, most likely our assumption is correct.

## Helmets

|  | \% Helmet Use |  | Sample Size |  |
| :--- | :---: | :---: | :---: | :---: |
| Location Type | 1999 | 2002 | 1999 |  |
| 2002 |  |  |  |  |
| Local streets | 16 | 19 | 1116 |  |
| Collector streets | 25 | 30 | 592 |  |
| Greenways | 42 | 55 | 404 |  |
| Mountain biking trails | 84 | 90 | 336 |  |
| Total |  |  | 2448 |  |

A law imposing helmet use was passed in early 2002.
Do these numbers support or disprove the fact that that the law was effective in having people wear their helmet?

## Helmets

|  | \% Helmet Use |  | Sample Size |  |
| :--- | :---: | :---: | ---: | :---: |
| Location Type | 1999 | 2002 | 1999 | 2002 |
| Local streets | 16 | 19 | 1116 | 848 |
| Collector streets | 25 | 30 | 592 | 513 |
| Greenways | 42 | 55 | 404 | 369 |
| Mountain biking trails | 84 | 90 | 336 | 219 |
| Total |  |  | 2448 | 1949 |

$$
1999=0.16 * 1116=178.56
$$

people were wearing their helmets

$$
\begin{gathered}
2002=0.19 * 848=161.2 \\
\text { people were wearing their helmets }
\end{gathered}
$$

## Helmets

|  | \% Helmet Use |  | Sample Size |  |
| :--- | :---: | :---: | :---: | :---: |
| Location Type | 1999 | 2002 | 1999 | 2002 |
| Local streets | 16 | 19 | 1116 | 848 |
| Collector streets | 25 | 30 | 592 | 513 |
| Greenways | 42 | 55 | 404 | 369 |
| Mountain biking trails | 84 | 90 | 336 | 219 |
| Total |  |  | 2448 | 1949 |

## Pooled $p=(178.56+161.2) /(1116+848)=0.173$

## Helmets

$$
z=\frac{(0.16-0.19)-0}{\sqrt{0.173(1-0.173)\left(\frac{1}{1116}+\frac{1}{848}\right)}}=-1.741
$$

We are asking if the law changed things so that

$$
\mathrm{p} 1<\mathrm{p} 2
$$

The P value is 0.04
Very low. Certainly there is a difference, But maybe not necessarily due to the law!

## Homework

## Page 455 E35-E45

Page 441 E17-E27
