

Math 140B Midterm 1

(Dated: September 27th 2017)

Name:

MARIA

SID:

Solutions

Write clearly and box all your numerical answers. Simplify all formulas to the very end. Round appropriately. Think before starting your calculations. Use the back for more space. Show all steps you are performing.

Useful formulas:

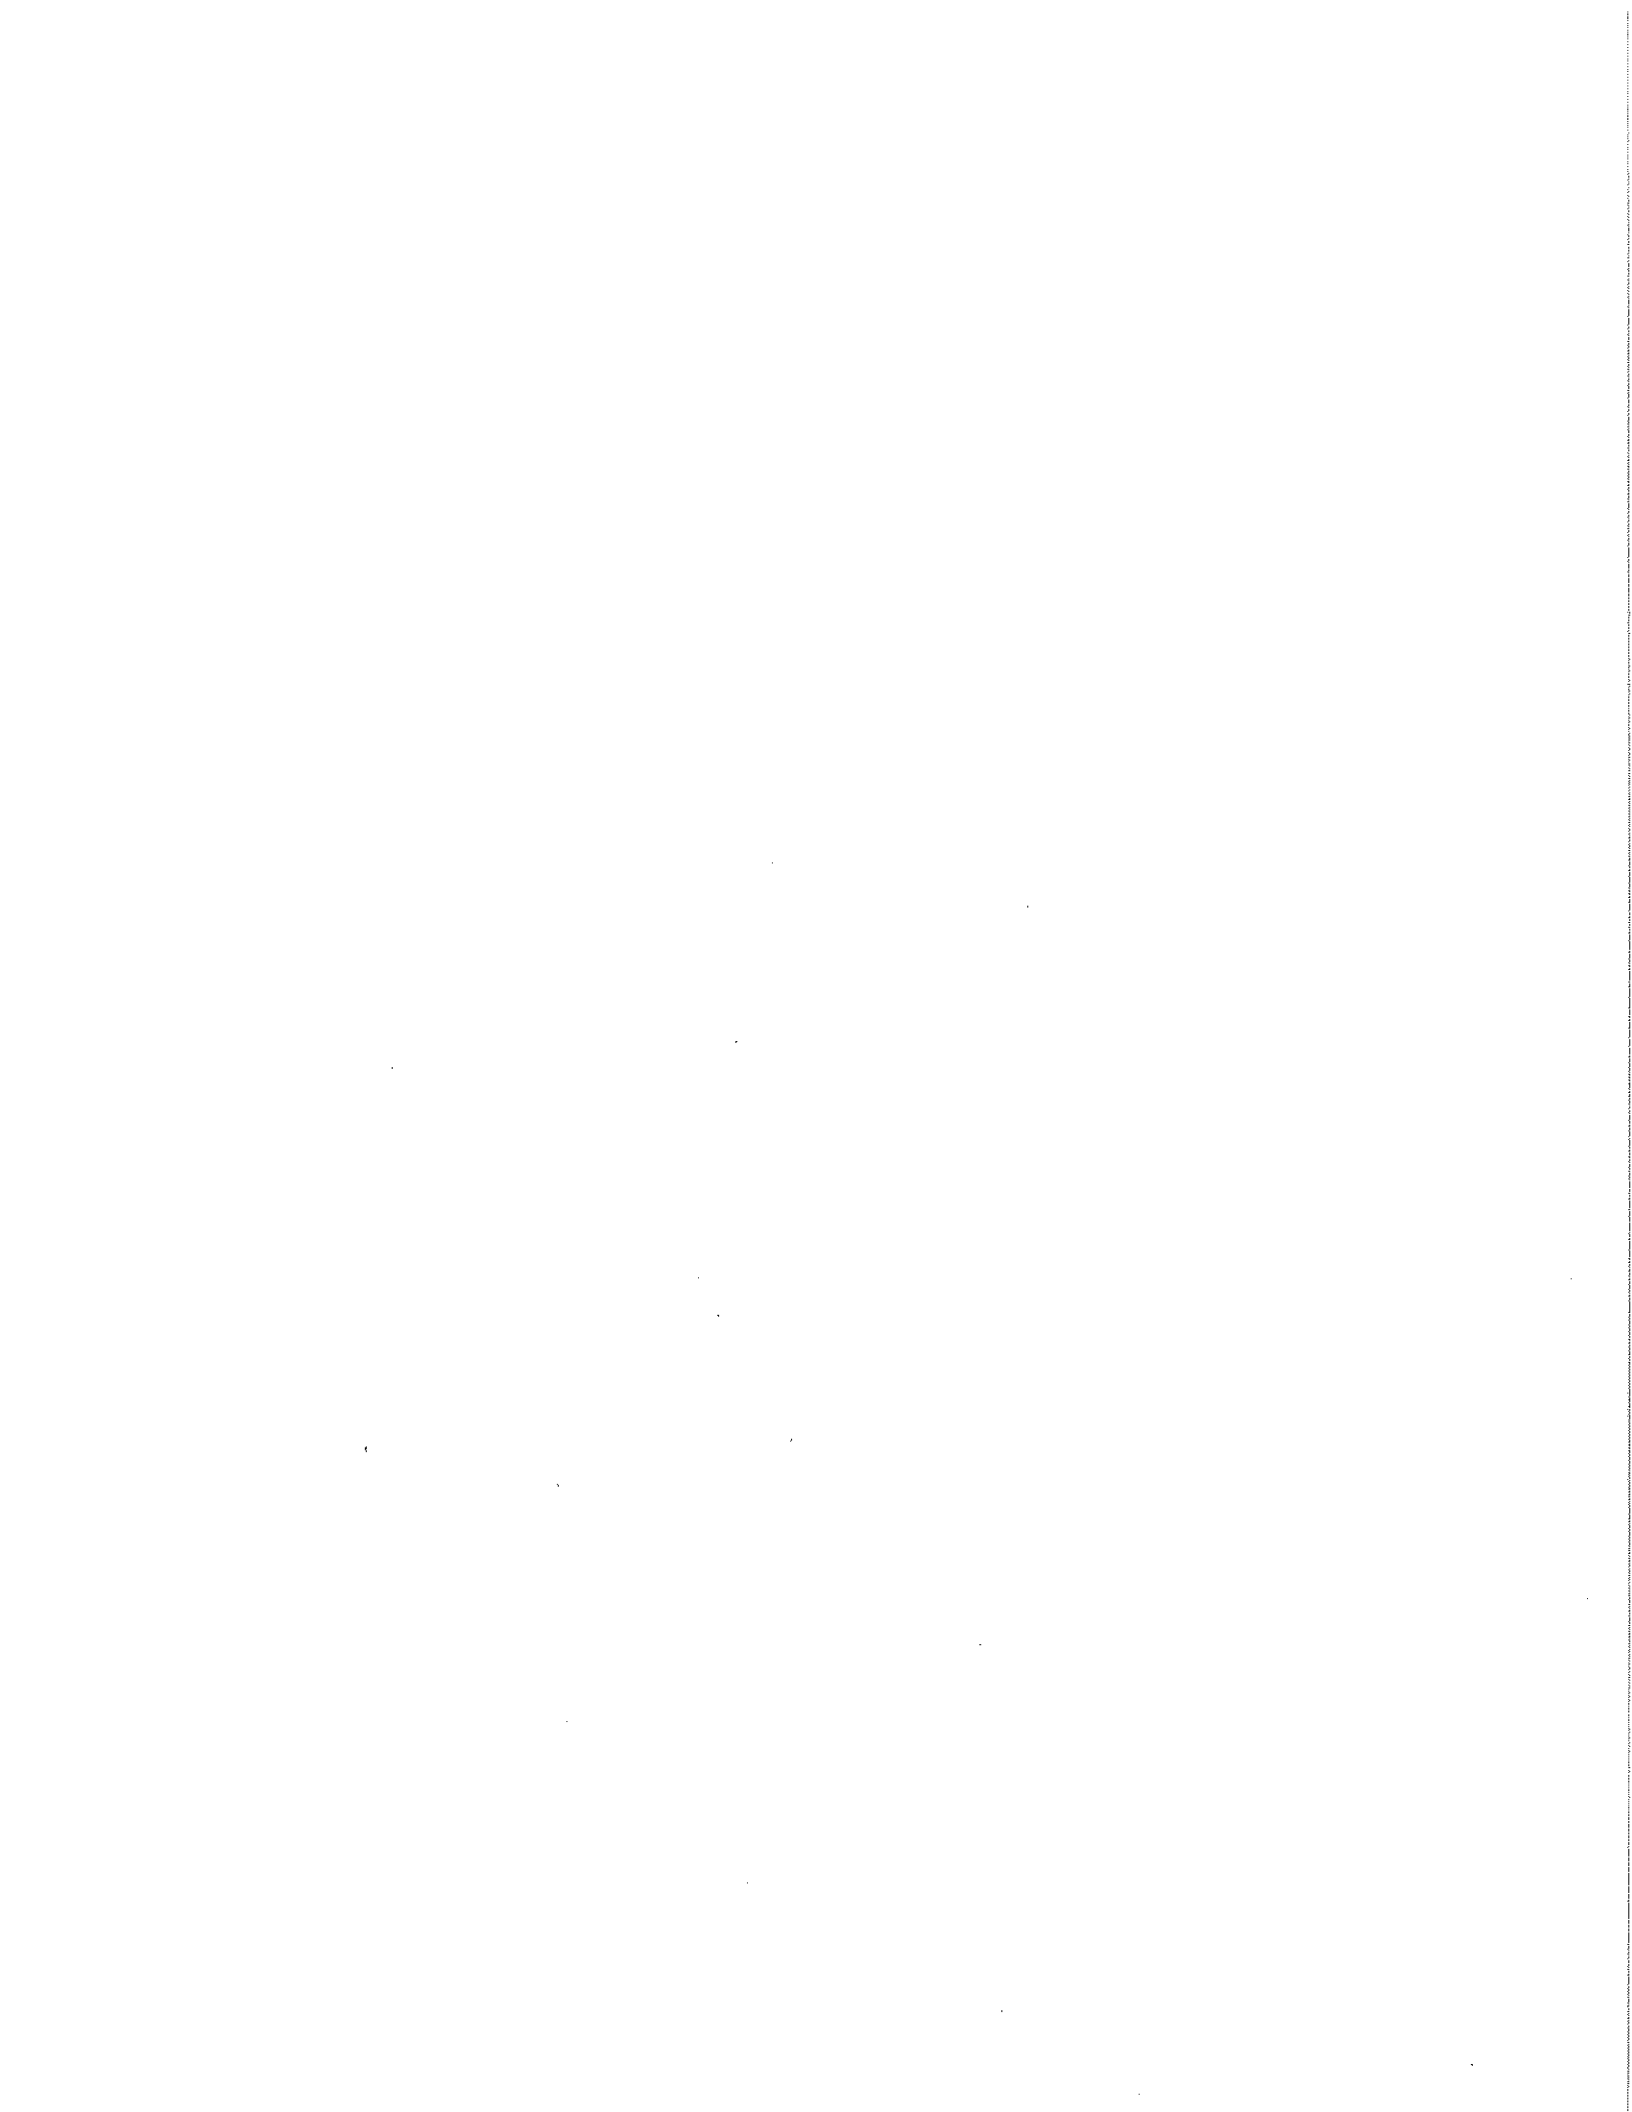

z-score for x from a normal distribution $N(\mu, \sigma)$ with mean μ and standard deviation σ

$$z = \frac{x - \mu}{\sigma} \quad (1)$$

$$\text{mean } \bar{x} = \frac{\sum_{i=1}^N x_i}{N} \quad (2)$$

$$\text{variance } \sigma^2 = \frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N - 1} \quad (3)$$

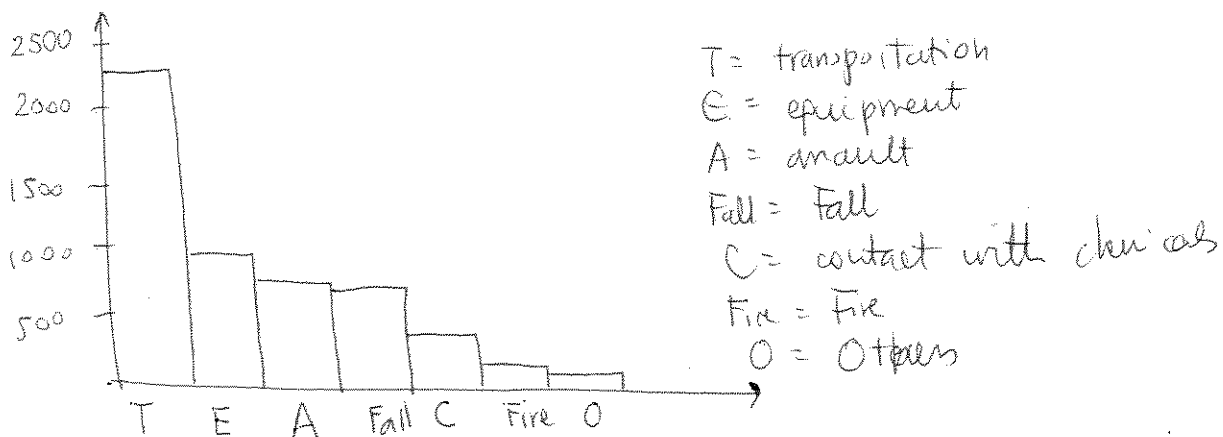

$$\text{standard deviation } \sigma = \sqrt{\frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N - 1}} \quad (4)$$

1) Indicate with a Q or with a C whether the following are quantitative or categorical variables:

- a) the length of the neck of giraffe Q
- b) the race of a person C
- c) whether or not a state's name consists of one word C
- d) the color of an MM candy C

2) In 2007, 5488 people were killed at work due to: transportation (2234), contact with equipment (916) assault (839), falls (835), exposure to toxic chemicals (488), fire (151), others (25). Make a bar graph.

3) Make a stem-plot of the number of shoes a group of teenagers self-reported: 30, 15, 10, 40, 94, 24, 27, 10, 25, 1, 27. Discuss outliers, center, variability, shape. Find median, the first and third quartiles and the interquartile range. Find the mean. Which is bigger, mean or median?

Stem-plot:

```

0 | 1
1 | 0 0 5
2 | 4 5 7 7
3 | 0
4 | 0
5 |
6 |
7 |
8 |
9 | 4
  
```

Sorted data: 1 10 10 15 24 25 27 27 30 40 94

Q1 = 10, Median = 25, Q3 = 30

$$IQR = Q3 - Q1 = 30 - 10 = 20$$

$$Mean = 27.504$$

Mean > Median

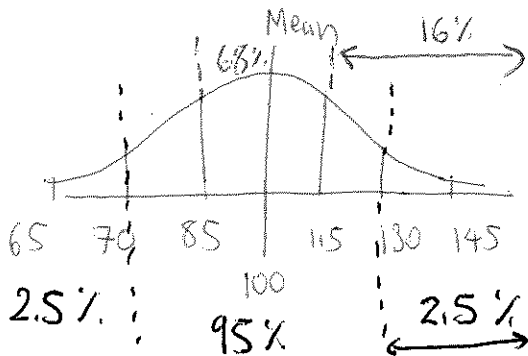

4) What if the diameters of a sample of new wedding rings coming off a single manufacturing line came out with a standard deviation of zero? Assuming the average diameter was correct, is this good or bad for the manufacturer? Explain.

- no variation
- rings are all the same size
- since we are assuming the average diameter was correct, this is GOOD for the manufacturer.

No "bad" ring was produced

5) Average IQ scores are $N(100,15)$: normally distributed with mean 100 and standard deviation 15.

- a) What percent of scores are between 85 and 115? 68%
- b) What percent of scores are between 70 and 130? 95%
- c) What percent of scores are between 55 and 145? 99.7%
- d) How high would your score need to be to fall in the highest 2.5 percent? higher than 130
- e) What are the scores of individuals in the highest 16 percent? higher than 115

6) In January the average temperature is 36°F , with a standard deviation of 10°F . In July the average is 74°F and the standard deviation is 8°F . Calculate the z-score for 55°F . Is a temperature of 55°F more unusual in January or in July?

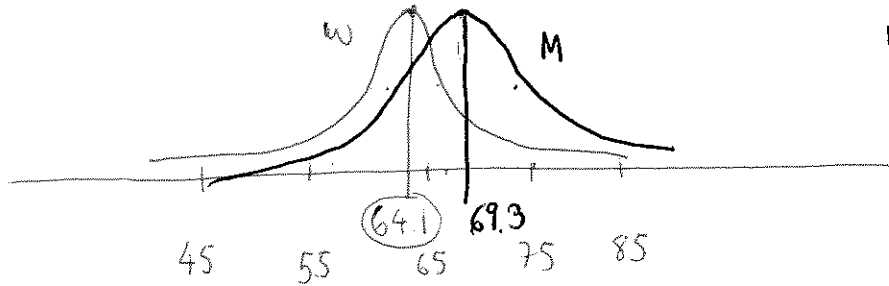

$$z = \frac{x - \mu}{\sigma}$$

$$\text{January} \Rightarrow \frac{55 - 36}{10} = 1.9$$

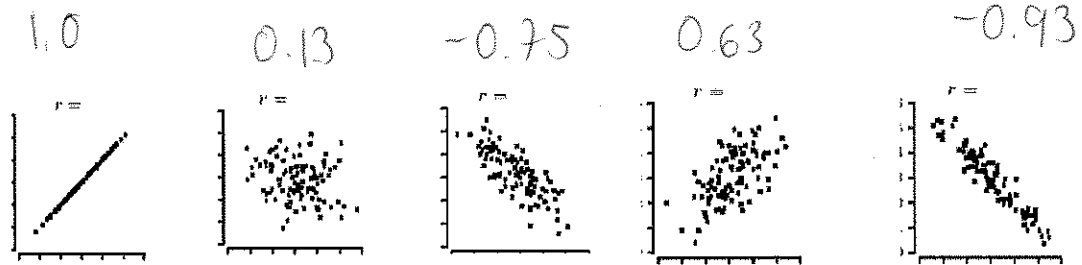

$$\text{June} \Rightarrow \frac{55 - 74}{8} = -2.375$$

55° is more unusual in June since we are 2.375 S.D away from the mean; in January we are "only" 1.9 SD from the mean.

7) The distribution of human height is approximately normal for both sexes. For men, the average is 69.3 inches with a standard deviation of 2.92 inches; for women the average is 64.1 inches with a standard deviation of 2.74 inches. Carefully sketch the distributions on the *same scale*.

men's is wider
SD is larger
than for
women.

8) Associate these correlation coefficients to the above scatterplots $r = -0.93$, $r = -0.75$, $r = 0.13$, $r = 0.63$, $r = 1.0$.

Table entry for z is the area under the standard Normal curve to the left of z .

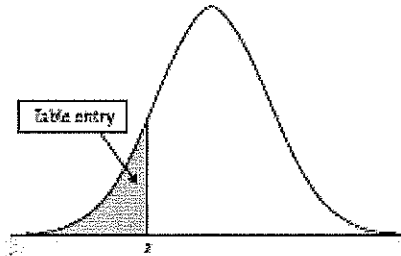

TABLE A STANDARD NORMAL CUMULATIVE PROPORTIONS

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09
