Name: (print) \_\_\_\_\_\_Solutions.

Each problem is worth 2 points. Show all your work.

1. Urn A has 5 white and 7 black balls. Urn B has 3 white and 12 black balls. We flip a fair coin. If the outcome is heads, then a ball from urn A is selected, whereas if the outcome is tails, then a ball from urn B is selected. Suppose that a white ball is selected. What is the probability that the coin landed tails?

$$P(w|V_{A}) = \frac{5}{12} \qquad P(V_{A}) = \frac{1}{2}$$

$$P(w|V_{B}) = \frac{3}{15} \qquad P(V_{B}) = \frac{1}{2}$$

$$P(W_{B}|W) = \frac{P(w|V_{B}) P(V_{B})}{P(w|V_{B}) P(W_{B})} + P(w|V_{A}) P(V_{A})$$

$$= \frac{\frac{3}{15} \cdot \frac{1}{2}}{\frac{1}{15} \cdot \frac{1}{2}} + \frac{3}{12} \cdot \frac{1}{2}$$

$$= \frac{36}{111} \approx 0.3243$$

- 2. Suppose that each child born to a couple is equally likely to be a boy or a girl, independently of the sex distribution of the other children in the family. For a couple having 5 children, compute probabilities of the following:
  - (a) All children are of the same sex.
  - (b) Exactly 3 of the children are boys.
  - (c) There is at least one girl.

There is at least one girl.

(a) 
$$P(GGGGG) + P(BBBBB) = (\frac{1}{2})^{\frac{5}{4}} + (\frac{1}{2})^{\frac{5}{4}} = \frac{1}{16}$$

(b)  $P("3boys") = (\frac{5}{2})(\frac{1}{2})^{\frac{3}{4}}(\frac{1}{2})^{\frac{1}{2}} = \frac{10}{32} = \frac{5}{16}$ 

There is at least one girl.

P("3boys") =  $(\frac{5}{2})(\frac{1}{2})^{\frac{3}{4}}(\frac{1}{2})^{\frac{1}{4}} = \frac{10}{32} = \frac{5}{16}$ 

There is at least one girl.

P("3boys") =  $(\frac{5}{2})(\frac{1}{2})^{\frac{3}{4}}(\frac{1}{2})^{\frac{1}{4}} = \frac{10}{32} = \frac{5}{16}$ 

There is at least one girl.

P(BBBBB) =  $(\frac{1}{2})^{\frac{5}{4}}(\frac{1}{2})^{\frac{5}{4}}(\frac{1}{2})^{\frac{5}{4}} = \frac{1}{16}$ 

P("at least one girl.

P("at least one girl.

P("BBBBB)

=  $(\frac{1}{2})^{\frac{5}{4}}(\frac{1}{2})^{\frac{5}{4}} = \frac{1}{16}$ 

There is at least one girl.

P(BBBBB) =  $(\frac{1}{2})^{\frac{5}{4}}(\frac{1}{2})^{\frac{5}{4}} = \frac{1}{16}$ 

3. In each of n independent tosses of a coin, the coin lands on heads with probability p. How large need n be so that the probability of obtaining at least one head is at least  $\frac{1}{2}$ ?

$$P\left(\text{at least one leads}^{n}\right) = 1 - P\left(\text{nall tails}^{n}\right)$$

$$= 1 - (1-p)^{n} \ge \frac{1}{2}$$

$$(1-p)^{n} \le \frac{1}{2}$$

$$\log (1-p) \le \log \frac{1}{2}$$

$$\log \left(\frac{1-p}{p}\right) \le \log \frac{1}{2}$$

$$\log \left(\frac{1-p}{p}\right) = \log \left(\frac{1}{2}\right)$$

$$\log \left(\frac{1-p}{p}\right) = \log \left(\frac{1}{2}\right)$$
