

220A Solutions

Assignment 1

1-17(a). Begin by writing down the ft^2 and then multiply by unity.

$$1 \text{ ft}^2 = 1 \text{ ft}^2 \cdot 1$$

The trick is to choose the "1" carefully. $1 = 24 \text{ hr/day}$, but that gets us nowhere. Since we are after yd^2 , choose $1 = 1 \text{ yd}/3 \text{ ft}$, thus

$$1 \text{ ft}^2 = 1 \text{ ft}^2 \cdot (1 \text{ yd}/3 \text{ ft})^2 = 0.111 \text{ yd}^2.$$

Notice that we multiplied by 1^2 . Also, if we had chosen $1 = 3 \text{ ft}/1 \text{ yd}$, we would have had to divide by 1^2 . The units tell us what to do.

$$\begin{aligned} \text{(b). } \text{m}^2 &= \text{m}^2 \cdot 1 = \text{m}^2 \cdot (100 \text{ cm}/1 \text{ m})^2 \cdot (1 \text{ in}/2.54 \text{ cm})^2 \cdot (1 \text{ ft}/12 \text{ in})^2 = \\ &= 10.76 \text{ ft}^2 \end{aligned}$$

1-36. $v = At^3 - Bt$

Since all terms must have the same units, At^3 and Bt must have the same units as v which are $[v] = L/T$. Thus, $[At^3] = L/T$ and $[Bt] = L/T$. Since $[At^3] = [A] \cdot T^3 = L/T$, then $[A] = L/T/T^3 = L/T^4$. Similarly, since $[Bt] = [B] \cdot T = L/T$, then $[B] = L/T^2$.

1-41. Write down 1.00 year and multiply by unity.

$$\begin{aligned} 1.00 \text{ year} &= 1.00 \text{ year} \cdot (365\frac{1}{4} \text{ days/year})(24 \text{ hr/day})(3600 \text{ s/hr}) = \\ &= 3.16 \times 10^7 \text{ s}. \end{aligned}$$

1-42. The author is asking how many acres are in 10^4 m^2 .

$$10^4 \text{ m}^2 = 10^4 \text{ m}^2 \cdot (10.76 \text{ ft}^2/1 \text{ m}^2)(1 \text{ acre}/4 \times 10^4 \text{ ft}^2) = 2.69 \text{ acres}.$$
