

Alignment: Solar image shift correction

There are a group of sunspot images taken from the campus telescope. Because of the atmospheric turbulence, these images are shift their position from time to time.

In this assignment, you are required to write a VI code to do the image shift correction for all images in a fold. The code must create a new fold in the current fold, which is used to save the corrected images so that all the corrected images can be saved in this new fold. The code must be able to automatically select all images (no matter how many images have) for this correction.

It must include two display windows: one show the first image used to select the template for pattern match and the other show the current corrected image. The front panel is recommend to include these associated information, as shown below:

Selected Path

C:\Ren\...s\Solar Image Shfit Correction\im10

Selected Image

C:\Ren\pp\Jan 5-2024\Spot 1\im15\C0.tif

Image number

20

Position Shift

x

-3.73837

y

-15.9217

Image Name

C9.tif

Select a template from this image

512x512 8-bit image 149 (116,38)

Current Correcting Images

512x512 0.71X Unsigned 16-bit image 0 (0,0)

An example code is provided:

You can use the provided example code to select all images in a folder and show all images in the folder.

This example code can also be used to compare/show the difference of the uncorrected and corrected images, in the associated folder.
