

Creating and Running Python Scripts

When starting a new project, create a directory and change into it:

```
mkdir directoryname  
cd directoryname
```

Running a Python file:

- all Python files should have a .py suffix
python *filename.py*

Or, add to the top of each Python file:

```
#!/usr/bin/env python
```

Then file can be run as:

```
>> ./filename.py
```

If permissions are not correct:

```
chmod +x filename.py
```
