Each makes its own image of outward reality to objectify inward reality, subjective life, feeling.

Primitive men live in a world of demonic Powers. Subhuman or superhuman, gods or spooks or impersonal magic forces, good or bad luck that dwells in things like an electric charge, are the most impressive realities of the savage’s world. The drive to artistic creation, which seems to be deeply primitive in all human beings, first begets its forms in the image of these all-surrounding Powers. The magic circle around the altar or the totem pole, the holy space inside the Kiwa or the temple, is the natural dance floor. There is nothing unreasonable about that. In a world perceived as a realm of mystic Powers, the first created image is the dynamic image; the first objectification of human nature, the first true art, is Dance.

EXPRESSIVENESS

When we talk about “Art” with a capital “A”—that is, about any or all of the arts: painting, sculpture, architecture, the potter’s and goldsmith’s and other designers’ arts, music, dance, poetry, and prose fiction, drama and film—it is a constant temptation to say things about “Art” in this general sense that are true only in one special domain, or to assume that what holds for one art must hold for another. For instance, the fact that music is made for performance, for presentation to the ear, and is simply not the same thing when it is given only to the tonal imagination of a reader silently perusing the score, has made some aestheticians pass straight to the conclusion that literature, too, must be physically heard to be fully experienced, because words are originally spoken, not written; an obvious parallel, but a careless and, I think, invalid one. It is dangerous to set up principles by analogy, and generalize from a single consideration.

But it is natural, and safe enough, to ask analogous
questions: “What is the function of sound in music? What is the function of sound in poetry? What is the function of sound in prose composition? What is the function of sound in drama?” The answers may be quite heterogeneous; and that is itself an important fact, a guide to something more than a simple and sweeping theory. Such findings guide us to exact relations and abstract, variously exemplified basic principles.

At present, however, we are dealing with principles that have proven to be the same in all the arts, when each kind of art—plastic, musical, balletic, poetic, and each major mode, such as literary and dramatic writing, or painting, sculpturing, building plastic shapes—has been studied in its own terms. Such candid study is more rewarding than the usual passionate declaration that all the arts are alike, only their materials differ, their principles are all the same, their techniques all analogous, etc. That is not only unsafe, but untrue. It is in pursuing the differences among them that one arrives, finally, at a point where no more differences appear; then one has found, not postulated, their unity. At that deep level there is only one concept exemplified in all the different arts, and that is the concept of Art.

The principles that obtain wholly and fundamentally in every kind of art are few, but decisive; they determine what is art, and what is not. Expressiveness, in one definite and appropriate sense, is the same in all art works of any kind. What is created is not the same in any two distinct arts—this is, in fact, what makes them distinct—but the principle of creation is the same. And “living form” means the same in all of them.

A work of art is an expressive form created for our perception through sense or imagination, and what it expresses is human feeling. The word “feeling” must be taken here in its broadest sense, meaning everything that can be felt, from physical sensation, pain and comfort, excitement and repose, to the most complex emotions, intellectual tensions, or the steady feeling-tones of a conscious human life. In stating what a work of art is, I have just used the words “form,” “expressive,” and “created”; these are key words. One at a time, they will keep us engaged.

Let us consider first what is meant, in this context, by a form. The word has many meanings, all equally legitimate for various purposes; even in connection with art it has several. It may, for instance—and often does—denote the familiar, characteristic structures known as the sonnet form, the sestina, or the ballad form in poetry, the sonata form, the madrigal, or the symphony in music, the contredance or the classical ballet in choreography, and so on. This is not what I mean; or rather, it is only a very small part of what I mean. There is another sense in which artists speak of “form” when they say, for instance, “form follows function,” or declare that the one quality shared by all good works of art is “significant form,” or entitle a book The Problem of Form in Painting and Sculpture, or The Life of Forms in Art, or Search for Form. They are using “form” in a wider sense, which on the one hand is close to the commonest, popular meaning, namely just the shape of a thing, and on the other hand to the quite unpopular meaning it has in science and philosophy, where it designates something
more abstract; "form" in its most abstract sense means structure, articulation, a whole resulting from the relation of mutually dependent factors, or more precisely, the way that whole is put together.

The abstract sense, which is sometimes called "logical form," is involved in the notion of expression, at least the kind of expression that characterizes art. That is why artists, when they speak of achieving "form," use the word with something of an abstract connotation, even when they are talking about a visible and tangible art object in which that form is embodied.

The more recondite concept of form is derived, of course, from the naive one, that is, material shape. Perhaps the easiest way to grasp the idea of "logical form" is to trace its derivation.

Let us consider the most obvious sort of form, the shape of an object, say a lampshade. In any department store you will find a wide choice of lampshades, mostly monstrosities, and what is monstrous is usually their shape. You select the least offensive one, maybe even a good one, but realize that the color, say violet, will not fit into your room; so you look about for another shade of the same shape but a different color, perhaps green. In recognizing this same shape in another object, possibly of another material as well as another color, you have quite naturally and easily abstracted the concept of this shape from your actual impression of the first lampshade. Presently it may occur to you that this shade is too big for your lamp; you ask whether they have this same shade (meaning another one of this shape) in a smaller size. The clerk understands you.

But what is the same in the big violet shade and the little green one? Nothing but the interrelations among their respective various dimensions. They are not "the same" even in their spatial properties, for none of their actual measures are alike; but their shapes are congruent. Their respective spatial factors are put together in the same way, so they exemplify the same form.

It is really astounding what complicated abstractions we make in our ordinary dealing with forms—that is to say, through what twists and transformations we recognize the same logical form. Consider the similarity of your two hands. Put one on the table, palm down, superimpose the other, palm down, as you may have superimposed cut-out geometric shapes in school—they are not alike at all. But their shapes are exact opposites. Their respective shapes fit the same description, provided that the description is modified by a principle of application whereby the measures are read one way for one hand and the other way for the other—like a timetable in which the list of stations is marked: "Eastbound, read down; Westbound, read up."

As the two hands exemplify the same form with a principle of reversal understood, so the list of stations describes two ways of moving, indicated by the advice to "read down" for one and "read up" for the other. We can abstract the common element in these two respective trips, which is called the route. With a return ticket we may return only by the same route. The same principle relates a mold to the form of the thing that is cast in it, and establishes their formal correspondence, or common logical form.
So far we have considered only objects—lampshades, hands, or regions of the earth—as having forms. These have fixed shapes; their parts remain in fairly stable relations to each other. But there are also substances that have no definite shapes, such as gases, mist, and water, which take the shape of any bounded space that contains them. The interesting thing about such amorphous fluids is that when they are put into violent motion they do exhibit visible forms, not bounded by any container. Think of the momentary efflorescence of a bursting rocket, the mushroom cloud of an atomic bomb, the funnel of water or dust screwing upward in a whirlwind. The instant the motion stops, or even slows beyond a certain degree, those shapes collapse and the apparent “thing” disappears. They are not shapes of things at all, but forms of motions, or dynamic forms.

Some dynamic forms, however, have more permanent manifestations, because the stuff that moves and makes them visible is constantly replenished. A waterfall seems to hang from the cliff, waving streamers of foam. Actually, of course, nothing stays there in mid-air; the water is always passing; but there is more and more water taking the same paths, so we have a lasting shape made and maintained by its passage—a permanent dynamic form. A quiet river, too, has dynamic form; if it stopped flowing it would either go dry or become a lake. Some twenty-five hundred years ago, Heraclitus was struck by the fact that you cannot step twice into the same river at the same place—at least, if the river means the water, not its dynamic form, the flow.

When a river ceases to flow because the water is deflected or dried up, there remains the river bed, sometimes cut deeply in solid stone. That bed is shaped by the flow, and records as graven lines the currents that have ceased to exist. Its shape is static, but it expresses the dynamic form of the river. Again, we have two congruent forms, like a cast and its mold, but this time the congruence is more remarkable because it holds between a dynamic form and a static one. That relation is important; we shall be dealing with it again when we come to consider the meaning of “living form” in art.

The congruence of two given perceptible forms is not always evident upon simple inspection. The common logical form they both exhibit may become apparent only when you know the principle whereby to relate them, as you compare the shapes of your hands not by direct correspondence, but by correspondence of opposite parts. Where the two exemplifications of the single logical form are unlike in most other respects one needs a rule for matching up the relevant factors of one with the relevant factors of the other; that is to say, a rule of translation, whereby one instance of the logical form is shown to correspond formally to the other.

The logical form itself is not another thing, but an abstract concept, or better an abstractable concept. We usually don’t abstract it deliberately, but only use it, as we use our vocal cords in speech without first learning all about their operation and then applying our knowledge. Most people perceive intuitively the similarity of their two hands without thinking of them as conversely related; they can guess at the shape of the hollow inside a wooden shoe from the shape of a human foot, without
any abstract study of topology. But the first time they see a map in the Mercator projection—with parallel lines of longitude, not meeting at the poles—they find it hard to believe that this corresponds logically to the circular map they used in school, where the meridians bulged apart toward the equator and met at both poles. The visible shapes of the continents are different on the two maps, and it takes abstract thinking to match up the two representations of the same earth. If, however, they have grown up with both maps, they will probably see the geographical relationships either way with equal ease, because these relationships are not *copied* by either map, but *expressed*, and expressed equally well by both; for the two maps are different projections of the same logical form, which the spherical earth exhibits in still another—that is, a spherical—projection.

An expressive form is any perceptible or imaginable whole that exhibits relationships of parts, or points, or even qualities or aspects within the whole, so that it may be taken to represent some other whole whose elements have analogous relations. The reason for using such a form as a symbol is usually that the thing it represents is not perceptible or readily imaginable. We cannot see the earth as an object. We let a map or a little globe express the relationships of places on the earth, and think about the earth by means of it. The understanding of one thing through another seems to be a deeply intuitive process in the human brain; it is so natural that we often have difficulty in distinguishing the symbolic expressive form from what it conveys. The symbol seems to be the thing itself, or contain it, or be contained in it. A child interested in a globe will not say: “This means the earth,” but: “Look, this is the earth.” A similar identification of symbol and meaning underlies the widespread conception of holy names, of the physical efficacy of rites, and many other primitive but culturally persistent phenomena. It has a bearing on our perception of artistic import; that is why I mention it here.

The most astounding and developed symbolic device humanity has evolved is language. By means of language we can conceive the intangible, incorporeal things we call our *ideas*, and the equally inostensible elements of our perceptual world that we call *facts*. It is by virtue of language that we can think, remember, imagine, and finally conceive a universe of facts. We can describe things and represent their relations, express rules of their interactions, speculate and predict and carry on a long symbolizing process known as reasoning. And above all, we can communicate, by producing a serried array of audible or visible words, in a pattern commonly known, and readily understood to reflect our multifarious concepts and percepts and their interconnections. This use of language is *discourse*; and the pattern of discourse is known as *discursive form*. It is a highly versatile, amazingly powerful pattern. It has impressed itself on our tacit thinking, so that we call all systematic reflection “discursive thought.” It has made, far more than most people know, the very frame of our sensory experience—the frame of objective facts in which we carry on the practical business of life.

Yet even the discursive pattern has its limits of usefulness. An expressive form can express any complex of
conceptions that, via some rule of projection, appears congruent with it, that is, appears to be of that form. Whatever there is in experience that will not take the impress—directly or indirectly—of discursive form, is not discursively communicable or, in the strictest sense, logically thinkable. It is unspeakable, ineffable; according to practically all serious philosophical theories today, it is unknowable.

Yet there is a great deal of experience that is knowable, not only as immediate, formless, meaningless impact, but as one aspect of the intricate web of life, yet defies discursive formulation, and therefore verbal expression: that is what we sometimes call the subjective aspect of experience, the direct feeling of it—what it is like to be waking and moving, to be drowsy, slowing down, or to be sociable, or to feel self-sufficient but alone; what it feels like to pursue an elusive thought or to have a big idea. All such directly felt experiences usually have no names—they are named, if at all, for the outward conditions that normally accompany their occurrence. Only the most striking ones have names like “anger,” “hate,” “love,” “fear,” and are collectively called “emotion.” But we feel many things that never develop into any designable emotion. The ways we are moved are as various as the lights in a forest; and they may intersect, sometimes without cancelling each other, take shape and dissolve, conflict, explode into passion, or be transfigured. All these inseparable elements of subjective reality compose what we call the “inward life” of human beings. The usual factoring of that life-stream into mental, emotional, and sensory units is an arbitrary scheme of simplification that makes scientific treatment possible to a considerable extent; but we may already be close to the limit of its usefulness, that is, close to the point where its simplicity becomes an obstacle to further questioning and discovery instead of the revealing, ever-suitable logical projection it was expected to be.

Whatever resists projection into the discursive form of language is, indeed, hard to hold in conception, and perhaps impossible to communicate, in the proper and strict sense of the word “communicate.” But fortunately our logical intuition, or form-perception, is really much more powerful than we commonly believe, and our knowledge—genuine knowledge, understanding—is considerably wider than our discourse. Even in the use of language, if we want to name something that is too new to have a name (e.g., a newly invented gadget or a newly discovered creature), or want to express a relationship for which there is no verb or other connective word, we resort to metaphor; we mention it or describe it as something else, something analogous. The principle of metaphor is simply the principle of saying one thing and meaning another, and expecting to be understood to mean the other. A metaphor is not language, it is an idea expressed by language, an idea that in its turn functions as a symbol to express something. It is not discursive and therefore does not really make a statement of the idea it conveys; but it formulates a new conception for our direct imaginative grasp.

Sometimes our comprehension of a total experience is mediated by a metaphorical symbol because the experience is new, and language has words and phrases only for
familiar notions. Then an extension of language will gradually follow the wordless insight, and discursive expression will supersede the non-discursive pristine symbol. This is, I think, the normal advance of human thought and language in that whole realm of knowledge where discourse is possible at all.

But the symbolic presentation of subjective reality for contemplation is not only tentatively beyond the reach of language—that is, not merely beyond the words we have; it is impossible in the essential frame of language. That is why those semanticists who recognize only discourse as a symbolic form must regard the whole life of feeling as formless, chaotic, capable only of symptomatic expression, typified in exclamations like “Ah!” “Ouch!” “My sainted aunt!” They usually do believe that art is an expression of feeling, but that “expression” in art is of this sort, indicating that the speaker has an emotion, a pain, or other personal experience, perhaps also giving us a clue to the general kind of experience it is—pleasant or unpleasant, violent or mild—but not setting that piece of inward life objectively before us so we may understand its intricacy, its rhythms and shifts of total appearance. The differences in feeling-tones or other elements of subjective experience are regarded as differences in quality, which must be felt to be appreciated. Furthermore, since we have no intellectual access to pure subjectivity, the only way to study it is to study the symptoms of the person who is having subjective experiences. This leads to physiological psychology—a very important and interesting field. But it tells us nothing about the phenomena of subjective life, and sometimes simplifies the problem by saying they don’t exist.

Now, I believe the expression of feeling in a work of art—the function that makes the work an expressive form—is not symptomatic at all! An artist working on a tragedy need not be in personal despair or violent upheaval; nobody, indeed, could work in such a state of mind. His mind would be occupied with the causes of his emotional upset. Self-expression does not require composition and lucidity; a screaming baby gives his feeling far more release than any musician, but we don’t go into a concert hall to hear a baby scream; in fact, if that baby is brought in we are likely to go out. We don’t want self-expression.

A work of art presents feeling (in the broad sense I mentioned before, as everything that can be felt) for our contemplation, making it visible or audible or in some way perceivable through a symbol, not inferable from a symptom. Artistic form is congruent with the dynamic forms of our direct sensual, mental, and emotional life; works of art are projections of “felt life,” as Henry James called it, into spatial, temporal, and poetic structures. They are images of feeling, that formulate it for our cognition. What is artistically good is whatever articulates and presents feeling to our understanding.

Artistic forms are more complex than any other symbolic forms we know. They are, indeed, not abstractable from the works that exhibit them. We may abstract a shape from an object that has this shape, by disregarding color, weight and texture, even size; but to the total effect that is an artistic form, the color matters, the
thickness of lines matters, and the appearance of texture and weight. A given triangle is the same in any position, but to an artistic form its location, balance, and surroundings are not indifferent. Form, in the sense in which artists speak of “significant form” or “expressive form,” is not an abstracted structure, but an apparition; and the vital processes of sense and emotion that a good work of art expresses seem to the beholder to be directly contained in it, not symbolized but really presented. The congruence is so striking that symbol and meaning appear as one reality. Actually, as one psychologist who is also a musician has written, “Music sounds as feelings feel.” And likewise, in good painting, sculpture, or building, balanced shapes and colors, lines and masses look as emotions, vital tensions and their resolutions feel.

An artist, then, expresses feeling, but not in the way a politician blows off steam or a baby laughs and cries. He formulates that elusive aspect of reality that is commonly taken to be amorphous and chaotic; that is, he objectifies the subjective realm. What he expresses is, therefore, not his own actual feelings, but what he knows about human feeling. Once he is in possession of a rich symbolism, that knowledge may actually exceed his entire personal experience. A work of art expresses a conception of life, emotion, inward reality. But it is neither a confessional nor a frozen tantrum; it is a developed metaphor, a non-discursive symbol that articulates what is verbally ineffable—the logic of consciousness itself.

It is customary to speak of an artist’s work as “creation.” A painter “creates” a painting. A dancer “creates” a dance, a poet “creates” a poem. If he slumps and gets nothing done he is apt to worry about not being “creative” (which usually makes him even more uncreative).

But when a factory worker, say a candy dipper or a weaver, has a sore throat and stays away from work he is not called “uncreative”; in fact, he may take that professionally idle day at home to play piano—which doesn’t produce any material object at all—and then he is said to be creating music. Why? Why is a piece of music a creation and a shoe usually just a product? The distinction, though it is protested by some philosophers who are anxious champions of democracy, like John Dewey, is a commonly accepted one. An automobile is not created on the conveyor belt, but manufactured. We don’t create bricks, aluminum pots, or toothpaste; we simply make such things. But we create works of art.
