Section A – Installation											
1				The machine is securely restrained to prevent movement in accordance with the machine manufacturer's recommendations or sound engineering practices.  8 CCR §3328(d)							
2				The machine's electrical attachment plug is connected directly to the building's wiring and that wiring's ampacity is rated for at least 125% of the machine's full load current.							
				24 CCR 3 §670.4(A) (2022)							
3				The machine's power cord and plug are in good condition with no cuts or fraying of the insulation.							
				8 CCR §3328(c)							
4				The machine is equipped with a means to promptly disconnect power, such as a switch, in case of emergency.  8 CCR §4001							
5				If the machine is powered by permanent conductors from the building's wiring, the incoming power supply circuit is terminated at a disconnecting means located immediately adjacent to the machine.  24 CCR 3 §670.4(B) / NFPA 79 §5.1.9.6 (2021)							
6				The disconnecting means is legibly marked to indicate the equipment it disconnects.  24 CCR 3 §110.22 / NFPA 79 §5.1.9.2 (2021)							
7				All disconnecting means enclosures are marked with a safety sign in accordance with ANSI Z535.4 to warn qualified persons of potential electric shock and arc flash hazards.  24 CCR 3 §110.16 / NFPA 70E §130.5(H)							

A minimum of 36 inches of clearance is provided in front of disconnecting means to ensure safe maintenance.  24 CCR 3 §110.26 (2022)  A written and verified Hazardous Energy Control procedure (Lock Out Tag Out / LOTO) is readily available for the machine.  8 CCR §3314(G)  Section B - Safeguarding  All points of operation or other danger zones created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.  8 CCR §5175(a)	#	YES	NO	N/A	Checklist Item	Comment	Date Corrected
A written and verified Hazardous Energy Control procedure (Lock Out Tag Out / LOTO) is readily available for the machine.  8 CCR §3314(G)  Section B - Safeguarding  All points of operation or other danger zones created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	8				provided in front of disconnecting means to		
Section B - Safeguarding  All points of operation or other danger zones created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.					24 CCR 3 §110.26 (2022)		
Section B - Safeguarding  All points of operation or other danger zones created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  1	9				Control procedure (Lock Out Tag Out / LOTO) is readily available for the machine.		
All points of operation or other danger zones created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	Sec	ction B	– Saf	feguar			
created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.  8 CCR §4184(a), 4188  All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.			<u> </u>	- <b>3</b>			
All power transmission pulleys, belts, chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  1	1				created by machine operations are adequately safeguarded by one of the following: fixed guard, movable interlocked guard, or awareness barrier.		
chains, gears, and lead screws are adequately guarded.  8 CCR §4070(a)  All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  1							
All protruding shaft ends are guarded (unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C – Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D – Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	2				chains, gears, and lead screws are		
(unless protruding less than 1/2 of the shaft's diameter beyond the bearing and with smooth edges)  8 CCR §4051(a)  On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C - Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D - Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.					8 CCR §4070(a)		
On lathes where revolving bar stock is being machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C – Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D – Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	3				(unless protruding less than 1/2 of the shaft's diameter beyond the bearing and		
machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.  8 CCR §4233  Section C – Industrial Hygiene  A noise survey has been performed while the machine is in normal operation.  8 CCR §5097(b)  Section D – Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.					8 CCR §4051(a)		
A noise survey has been performed while the machine is in normal operation. 8 CCR §5097(b)  Section D – Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	4				machined, that portion of the bar stock which extends beyond the machine is guarded by a trough or tube or by other effective means.		
A noise survey has been performed while the machine is in normal operation. 8 CCR §5097(b)  Section D – Housekeeping  All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.	Sec	ction C	– Ind	lustria	I Hygiene		
All raw turnings, chips, and swarf are being collected daily and placed in closed-top  1 □ □ □ metal containers located in a safe storage area.					A noise survey has been performed while the machine is in normal operation.		
All raw turnings, chips, and swarf are being collected daily and placed in closed-top  1 □ □ □ metal containers located in a safe storage area.	Sec	ction D	– Ho	useke	eping		
					All raw turnings, chips, and swarf are being collected daily and placed in closed-top metal containers located in a safe storage area.
